

Assignment :

Use Ask Mode to analyze the existing project structure and identify all impacted files required for the Playwright with TypeScript implementation.

Prompt given:

Under the Settings tab, select Playwright + TypeScript as the default combination.

Before making any changes:

1. First, understand the impacted files and existing code/configuration related to the default framework/language selection.
2. Identify exactly which file(s) and code/configuration will be modified.
3. Explain the proposed changes and their impact.
4. Do not make any changes yet.
5. Since this is Agent Mode, wait for my explicit approval before modifying any file or configuration.
6. Only after I provide approval, proceed with the required changes.
7. After making the changes, summarize the files modified and the changes made

VS Code response:

I've confirmed the default selections are controlled in the settings UI and by the chat logic that validates supported combinations; I'm narrowing it down to the exact files that need to change before any edit is made.

Current default framework/language selection

I have reviewed the existing setup and the default selection is currently hard-coded in the UI and validated in the chat logic.

Files involved

- [panel.html:95-114](#)
 - The Settings tab currently defaults to:

- Language = Java
 - Browser Engine = Selenium
 - [chat.js:14-45](#)
 - The code initializes a default generator type:
 - [codeGeneratorType = 'SELENIUM JAVA PAGE ONLY'](#)
 - [chat.js:601-669](#)
 - The validation logic explicitly supports only Java + Selenium:
 - [isJavaSelenium\(language, engine\) { return language === 'java' && engine === 'selenium'; }](#)
 - It warns and blocks other combinations as unsupported
 - [prompts.js:1-216](#)
 - The prompt library currently contains only Selenium Java / Cucumber prompts
 - There are no Playwright + TypeScript prompt templates yet
-

Exact impact for “Playwright + TypeScript” as default

If this default is changed to Playwright + TypeScript, the affected code is:

1. [panel.html:95-114](#)
 - Change the default selected values from Java/Selenium to TypeScript/Playwright
2. [chat.js:14-45](#)
 - Update the default generator type and any initialization assumptions
3. [chat.js:601-669](#)
 - Extend the supported combinations logic so Playwright + TypeScript is treated as valid instead of unsupported
4. [prompts.js:1-216](#)

- Add the Playwright TypeScript generation prompt(s) and ensure the selected prompt key matches the new default flow

[manifest.json](#) is not the place where the default framework/language selection is defined. It is not currently controlling the default UI option; that behavior lives in the side panel HTML and JS logic above.

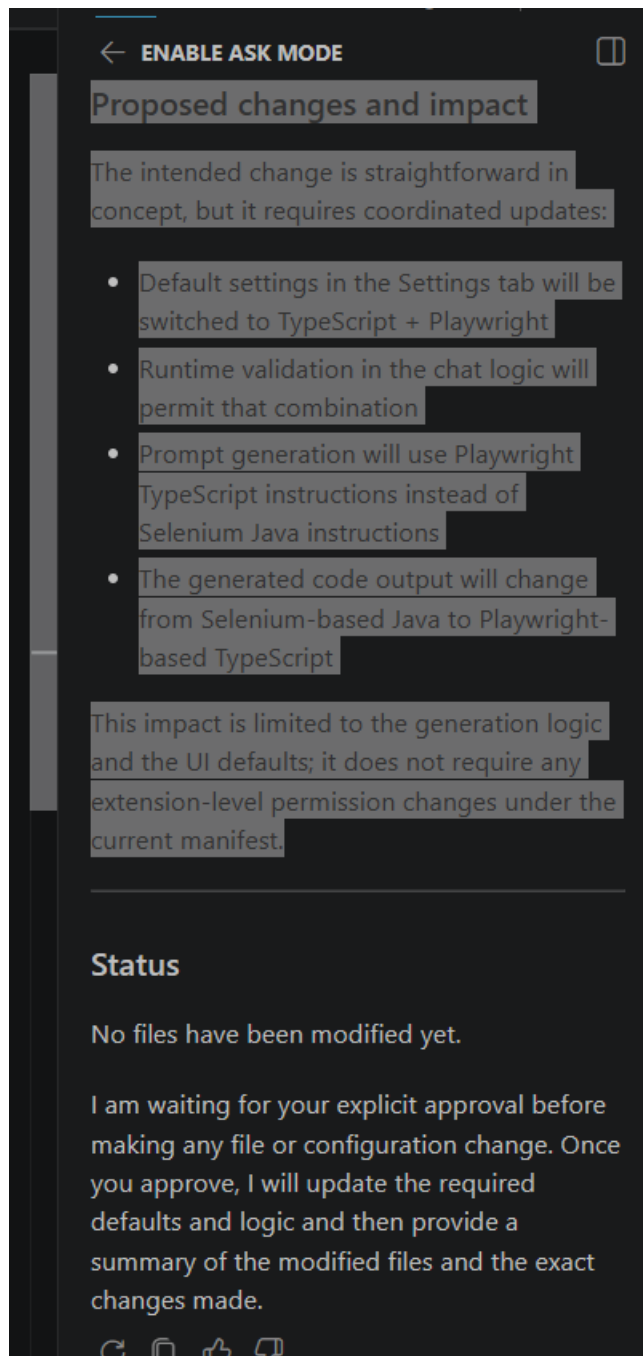

Proposed changes and impact

The intended change is straightforward in concept, but it requires coordinated updates:

- Default settings in the Settings tab will be switched to TypeScript + Playwright
- Runtime validation in the chat logic will permit that combination
- Prompt generation will use Playwright TypeScript instructions instead of Selenium Java instructions
- The generated code output will change from Selenium-based Java to Playwright-based TypeScript

This impact is limited to the generation logic and the UI defaults; it does not require any extension-level permission changes under the current manifest.

Implementation:

Agent mode action:

combinations

- In `prompts.js` :
 - Added a new default prompt template for Playwright TypeScript page object generation
 - Added `PLAYWRIGHT_TS_PAGE_ONLY` to `CODE_GENERATOR_TYPES`

Impact

This affects the default behavior of the Settings tab and the code generation prompt path. The extension will now prefer Playwright + TypeScript rather than Selenium + Java unless the user changes the settings manually.

Verification

I checked the edited files with the workspace error checker and it reported:

- No errors found in `panel.html`
- No errors found in `chat.js`
- No errors found in `prompts.js`

If you want, I can next add a more complete Playwright TypeScript training prompt set beyond the page-object default, such as test generation and BDD/feature-based output.
